

Lab 01

Exercises

1. Comment the **.MODEL SMALL** line of the code and see what happens. Then, show the code and the screenshot of output and describe the output briefly.
2. Comment the **.CODE** line of the code and see what happens. Then, show the code and the screenshot of the output and briefly describe the output.
3. Remove or comment the line of code that defines the **.STACK** segment and see what happens. Then, show the code and the output of the assembler (screenshot) and briefly describe the output.
4. In the code of the first program (that prints a character on the screen), change the name of the MAIN procedure to “your name” (i.e., create the procedure/function with your name instead of MAIN). Then, show the code and the screenshot of the output.
5. Modify the code and try printing the letter without using single quotes. Try
 - a. printing a letter using double quotes
 - b. printing a letter using its ASCII code (**Hint:** the ASCII codes of capital alphabets start from 65 and of small alphabets start from 97)
6. Write the assembly language code to print your first name on the screen.
7. Modify the code so that your first name is printed in such a way that each of the characters should be printed on a separate line.
8. Write the assembly language code to print the numbers from 1 to 5, each on a separate line (using their ASCII codes). **Hint:** the ASCII codes of the numbers start from 48. The ASCII code of the number 0 is 48; the number 1 is 49, and so on.
